

INTERIOR DOORS TRAINING GUIDE

WOOD INTERIOR DOORS

Rarely are solid, one-piece wood doors available, because wood of that size is nearly impossible to obtain, and solid one-piece slabs can warp or crack. Solid wood doors are now built with a frame-and-panel construction. This will look and feel just like a one-piece wood door even though it is not. An example is the six-panel design, it is constructed of individual panels, mullions, stiles, and rails that hold floating panels together and give the look and feel of one solid piece of wood. There are several designs and wood species to select from, giving customers the ability to find just the right style to meet their needs.

LOUVER DOORS

Louver doors allow air flow while maintaining privacy. They are great where circulation is needed such as closets and furnace rooms. Yet their visual charm and functionality should not be overlooked in the rest of the home. A louver door can add flare and visual interest. Louver doors are available in both stainable pine and paint grade primed. There are three different styles to choose from in the CMC/Paradigm system. They are available with either Plantation slats 2-1/4 inches and Traditional slats 1-3/16 inches.

2 Panel Louver over
Raised Panel

The Louver door will let in natural light and air keeping musty odors at bay. The shutter like slats face downward obstructing the view, allowing circulation without compromising privacy.

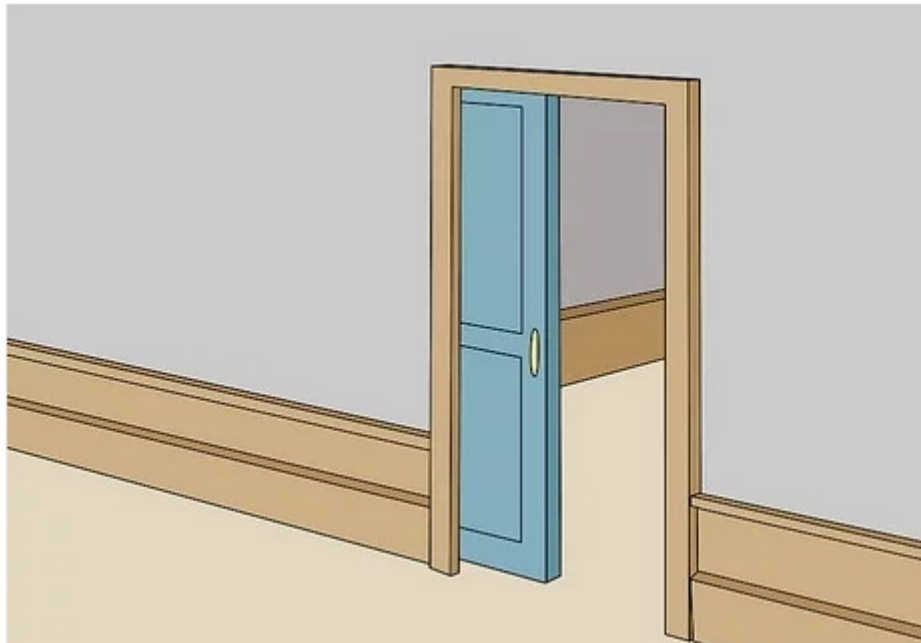

To ensure the customer's door arrives with the slats down to the correct side ask how they intend to hang the door.

If the customer is hanging the door pushing into the room. You will need to order as slats UP to the hinge side.

If the customer intends to install swinging out. You will need to order as slats DOWN to the hinge side.

POCKET DOORS

Pocket doors are a blast from the past, that is making a comeback. First popular in the late 1800s, these doors are elegant and practical. When wall space is at a premium and there is not enough room for a door to swing into a room, a pocket door is the answer. A pocket door slides on a track and hides within the wall cavity. Best feature of all, any door can be a pocket door, if it meets the requirements outlined in the hardware kit and rough opening. French door, molded door, router carved, they will all work.

HOLLOW CORE MOLDED DOORS

Hollow core molded doors have minimal sound-blocking ability. The empty space lends the word hollow to the door. Being hollow helps make the door light so that it is easy to hang and easy to swing. Hollow core doors are vastly cheaper than either solid wood or solid core doors. If you need to install doors throughout your entire home, you can save money by using hollow core doors.

SOLID CORE

Solid-core doors represent an interior construction method in which a fine-grade surface veneer is glued over a solid core made of engineered wood. Solid core interior doors provide the durability and sound insulation of a wood door without the hefty price. Whereas wood doors tend to expand and contract with changes in humidity and temperature, the engineered core resists these fluctuations.

FLUSH INTERIOR DOORS

Flush interior doors have that sleek modern look and feel, blending seamlessly into any décor. Flush doors have a single piece of veneer attached with adhesive. The flush surface when painted or stained can make cleaning easier which means it can look new longer. They are available in both solid core and hollow core. This is a great way to save money.

Solid core flush doors give the same sound deadening effect of a solid core molded door.

BIFOLD DOORS

Bifold doors do not swing in or out but slide along a track, each panel or leaf folding upon the other. Bifolds come in either 2 or 4 leaf options. A bifold door can be a versatile space saving option. Commonly used for closets and laundry rooms, it can also be used to divide two rooms, giving a more complete opening, and taking up less space than a double unit. The wide range of panel options give the customer more ways to add visual interest and design flare to the decor.

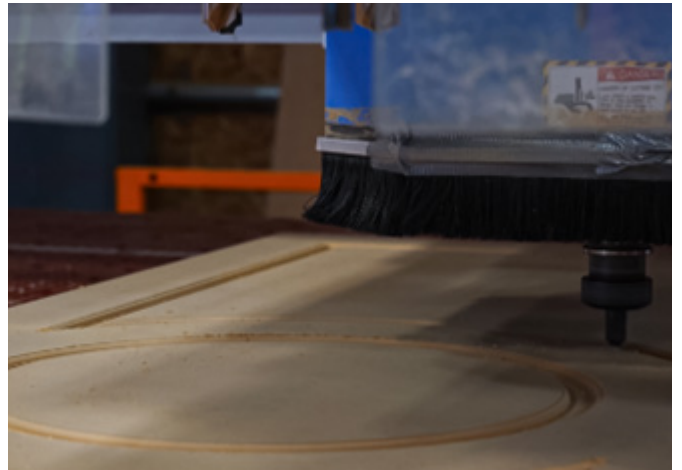

BARN DOORS

The popular barn door is artwork that serves a purpose. Designers are using barn doors for both function and beauty. The barn door hardware allows the customer to choose the style of slab creating unlimited possibilities. A barn door is hung from a track that will allow it to slide in front of the wall and cover the opening. While not ideal for privacy it is perfect for adding character to any space. Since the door does not swing into the room it is a great option for smaller spaces.

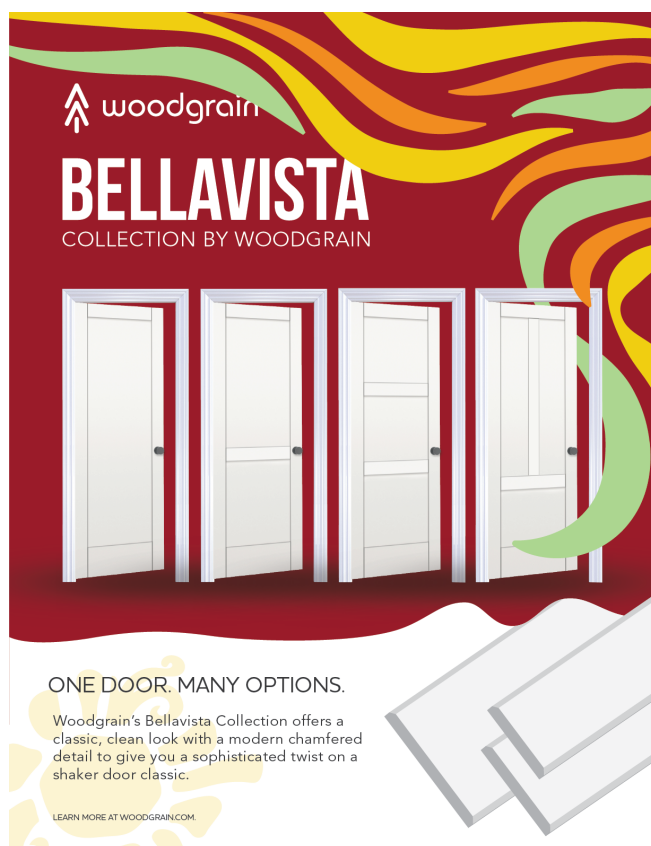

ROUTER CARVED

The Router carved design offers a pop of excitement and design interest in any home. Router carved doors have a smooth easy to paint surface that will not crack. They have a solid wood edge installed in each stile allowing for easy mortise and strength for holding screws. They resist shrinkage, expansion, and warping.

BELLAVISTA

Bellavista offers a classic, clean modern look. The smooth rounded edges to the design give a twist to the classic shaker door with its sharp edge. The Bellavista offers an array of design options with both panel and glass selections to make the home a show piece.

INTERIOR DOORS WITH GLASS

The style and elegance of a glass door in your home is unmistakable. It is the first thing you see when walking into a room, making a bold statement. All interior glass doors are made with single glazed tempered glass and come in a variety of styles and sizes. Glass doors may not reduce sound like a solid door, but they can still provide privacy. The images below are glass selections available through the CMC program.

Note the number beneath each image. The first number indicates the amount of privacy each glass profile allows. The second number indicates the amount of light the glass profile allows to penetrate. This is on a scale of 1 to 10.

Example: **1** **1** on the clear glass indicates it is completely clear and allows the maximum amount of light.

A PROTECTIVE FILM IS APPLIED TO ALL INTERIOR GLASS DOORS

Plastic film protection should be removed immediately after applying the finish. Failure to remove the plastic film at this time may cause harm to the glass and create difficulty removing later. Film should be removed by scoring the edges carefully under sticking or profile edge. Peel off by hand.

DOORS WITH WRITING OR TEXTURE ON THE GLASS

Glass doors with writing or texture will require information from your customers on how they intend to hang the door.

The CMC/Paradigm system will ask if you would like to read the door or feel the texture on the hinge side or the stop side? **This is not the same as handing.** This should be approached as two different questions when addressing your customer.

EXAMPLE USING PANTRY DOOR

Inswing: If the customer is using the door as an inswing, pushing the door into the pantry, then it should be read from the **Stop side**.

Outswing: If the customer is turning the unit around when installing and is pulling the door out, it should read from the **Hinge side**.

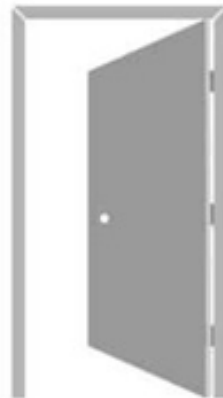

HANDING AN INTERIOR DOOR

All interior doors should be handed from the stop side as if they are swinging into the room.
